

### Atomicorp Enterprise Ossec Getting Started

- Ensure that you have the proper Docker utility installed. You may use the full version of Docker on linux or Windows 10 pro or enterprise, but you must use Docker Toolkit on Windows 10 home.
- Run: `docker run -it <image-name>` to create and automatically be put inside your container. From here you may run commands as normal.
- If you exit the container it will automatically be shut off. To turn it back on run `docker container start <id of container>`. From there you can get back inside the container by running `docker exec -it <id of container> /bin/bash`.

Unfinished. Later on update this with the instructions to add an agent to the product.
